A POWER PLANT BIG ENOUGH TO RUN 600,000 HOMES — 10 MILES UPWIND OF SAN ANGELO.

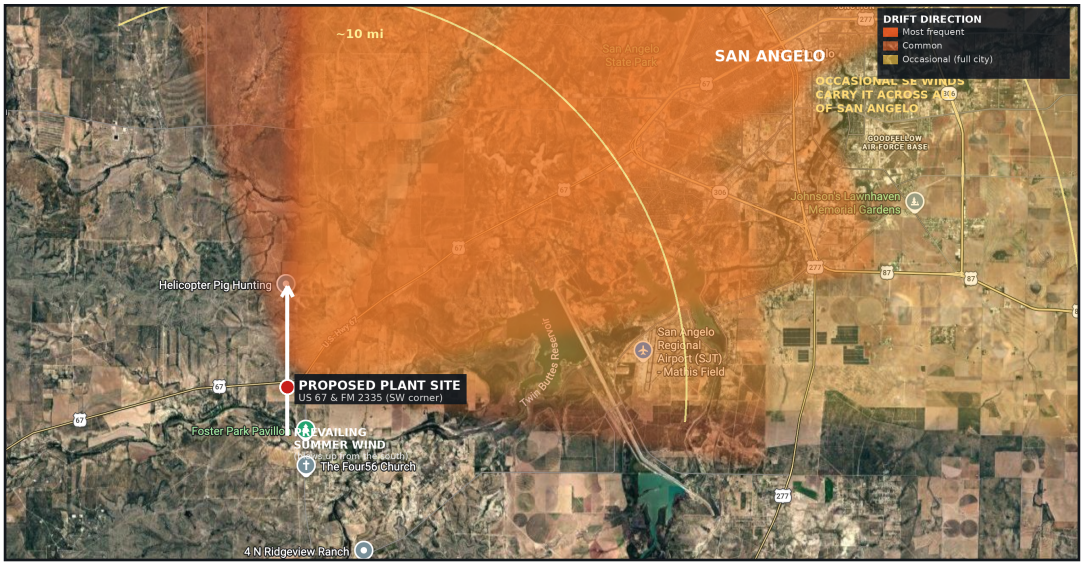

Illustration of prevailing-wind drift — not a dispersion model. Wind: NOAA & Windfinder, Mathis Field (prevailing South). Particles & ozone keep forming downwind.

1 THE SHEER SCALE

About 2.7 gigawatts (est.) — enough electricity for roughly 600,000 homes, or about ten times everything San Angelo uses. It would rank among the largest power plants in America. Yet not one watt is for us: it runs the data center, and the data center alone.

2 OUR AIR CAN'T ABSORB THIS

By the applicant's own numbers, this plant would release about 697 tons of hazardous air pollutants a year — the equivalent of roughly 7 rail cars of hazardous chemicals, vented into the air we breathe. That's 28 times the federal “major source” threshold, and it includes formaldehyde and acetaldehyde, both known or probable carcinogens — on top of hundreds more tons of smog-forming pollutants. Refinery-scale pollution, upwind of a city that has never breathed anything like it.

3 AND IT LANDS RIGHT ON US

These engines don't just release soot — they release the raw ingredients that cook into smog and fine particles downwind. Fresh exhaust leaves the stacks as nitrogen oxides and ammonia; as the plume drifts and bakes in the sun, those combine into ozone and lung-damaging ammonium-nitrate particles. It isn't instant — it takes hours, so it peaks 10 to 30 miles downwind. San Angelo sits almost exactly in that window. The pollution finishes forming right about where we live, on the hottest, stillest days — and no one is measuring it.

4 WHERE WILL THE WATER COME FROM?

From our groundwater. At the June 2 county meeting the developer confirmed the plan relies on an on-site well for water, clearing mesquite to “free up” water, and desalinating brackish water. In a region where water is everything, drilling into the same aquifer our families, ranches, and farms depend on is not a small ask.

5 WHOSE GAS IS IT IN A FREEZE?

The plant would burn about 440 million cubic feet of gas a day — roughly a million dollars' worth — fed off the new Matterhorn Express pipeline. That's a massive new demand on the same West Texas gas supply that Texas power plants and homes depend on in a hard freeze. We all remember what strained gas supplies cost Texas during Winter Storm Uri.

THIS ISN'T ABOUT BEING ANTI-ENERGY. WEST TEXAS POWERS AMERICA.

s about scale and place — a plant this large, this close, putting our air and water at risk, decided before we were ever really aske

SOURCES: TCEQ Form PI-1 General Application & emission-calculation workbooks, Westline TX Holdings LLC, “Westline 2335,” filed June 2026 (240 engines @ 95 MMBtu/hr, 180-ft stacks, 83% capacity, potential-to-emit incl. 697 tpy hazardous air pollutants, $20,000 expedite surcharge) • rail-car equivalent at ~100 tons/car • Bergen Engines / Langley Holdings specifications (B36:45V20 ≈ 11.2 MW) • power-for-homes at ~1 MW per ~200 Texas homes (ERCOT) • Tom Green County Commissioners' Court, June 2, 2026 (developer statements on on-site well, mesquite removal, brackish desalination; on-site gas generation with grid for backup) • WhiteWater Midstream, Matterhorn Express Pipeline (42-in, 2.5 Bcf/d, in service Oct. 2024) • City of San Angelo Water Utilities correspondence, Nov.–Dec. 2025 • wind: NOAA design data & Windfinder, Mathis Field (KSJT), prevailing South. Figures marked (est.) are derived from stated heat input and manufacturer ratings; the filing does not state megawatts. Map is an illustration of wind direction, not a dispersion model. Prepared by community volunteers from public records. Not legal advice.

WHAT WE CAN DO THE PERMIT IS AN APPLICATION — NOT AN APPROVAL. HERE IS THE CLOCK, AND THE MOVES.

Neighbors have every right to ask for a careful review instead of a rushed one. Here are simple ways to be heard.

WE GET TWO NOTICES IN THE NEWSPAPER. AFTER THAT, IT'S DECIDED WITHOUT US.

THE ONE RULE: SEND A COMMENT AT THE FIRST NOTICE.

One written comment — a few sentences is enough — keeps your seat at the table for the whole process.

1 IF YOU LIVE NEAR THE SITE: YOU CAN ASK FOR A HEARING

Texas law gives people who live or own land near the site or downwind the right to request a contested case hearing — a formal review where the company answers questions under oath. On the prevailing south wind that means the north-side neighborhoods most of all: The Bluffs, Lake View, and PaulAnn, and anything north of Highway 67. If you're in that path, you may have standing most residents don't — reach out and we'll help.

2 START MEASURING OUR AIR — NOW, BEFORE IT TURNS ON

We're asking the City and County to install ozone and fine-particle monitors now. One to two full summers of "before" data — especially the hottest months — is the only way our community will ever prove what changed. Once the plant starts, that baseline is gone for good.

3 ASK ABOUT THE 40 MISSING ENGINES

Their air modeling assumed 200 engines running — the permit asks for 240 — and the official stack-data form is blank. Put the question in your comment. TCEQ must answer every comment in writing.

4 ONE CALL TO OUR LEGISLATORS

When a state legislator asks, TCEQ holds a public meeting right here in San Angelo, so questions get asked and answered in the open. One respectful phone call is all it takes to request that.

5 ASK FOR SAFEGUARDS IN THE PERMIT

A permanent public air monitor, a limit at the 200 engines they actually modeled, and testing for the carcinogenic pollutants. Reasonable conditions are how permits protect neighbors.

6 KEEP AN EYE ON THE WATER

Well permits are decided at the local groundwater district, often with little public notice. Watching for applications on this tract is how neighbors get answers about the water we all share.

7 ASK EPA TO LOOK TOO

697 tons a year of hazardous pollutants triggers a rare case-by-case federal toxics review. A letter to EPA Region 6 simply asks the federal experts to double-check the state's work.

8 PUBLIC RECORDS ARE FREE

Anyone can request the full file — TCEQ correspondence, county road and TxDOT permits — at no cost. Informed neighbors ask better questions. That's how a community stays ahead of the next one.

HOW IS THIS LEGAL? THE LAWS BEHIND IT — AND OUR VOICE IN AUSTIN.

A plant that powers only itself needs no PUC license under longstanding Texas law. Recent laws have narrowed what communities can do: HB 2127 (2023) limited city and county authority; SB 1017 (2023) bars local rules on engines by fuel source; SB 2627 (2023) funds new gas plants with state loans; and SB 6 (2025) reviews big grid-connected loads but largely exempts brand-new, fully islanded plants like this one. Our own Rep. Drew Darby authored HB 3970 (2025) to fast-track large loads that bring their own behind-the-meter generation — it passed the House 142–0 and died in the Senate — and he says the framework "is still evolving." As his constituents, we're asking him to make communities like ours part of how it evolves in 2027.
